

Figure 1. Schematic diagram of the experimental setup. The experimental setup consists of a laser source, a beam splitter, a lens, a sample, a lens, a beam splitter, a lens, a detector, and a computer. The laser source emits a beam that passes through a beam splitter, a lens, and a sample. The beam then passes through another lens, a beam splitter, and a lens before reaching the detector. The computer is connected to the detector and the beam splitter.
